

5 test cases for UI functionality of <https://www.google.de/>

- Check google page is opening or not after entering https://www.google.de in the URL box or not.
- Check the search button whether it's working or not.
- Check the information should correctly visible.
- Check google apps whether it shows all the applications or not.
- Check the google login whether it opens the login window or not.

I have made python script. I have automated first three test cases using selenium.
